

Category	Description	Points
Problem Motivation & Research Question	Clearly identifies an AI systems problem and explains why it matters in modern AI/ML systems (e.g., efficiency, scalability, serving, training infrastructure, resource management, memory optimization, scheduling, distributed execution, or system performance). The motivation should clearly articulate the AI systems contribution of the project and connect to AI systems topics covered in this course, rather than focusing primarily on model architecture or algorithmic improvements.	10
System Design	Clearly presents architecture, design choices, system components, and design rationale. Explains system-level decisions. The presentation should emphasize <i>how the system works</i> rather than only describing background material.	20
Implementation & Engineering Details	Demonstrates implementation effort, prototype development, frameworks, models, infrastructure choices, or engineering challenges encountered during development. Highlight important code changes or new code.	25
Evaluation Methodology	Clearly explains metrics, baselines, workloads, and experimental setup. Evaluation methodology should align with the system goals.	5
Experimental Results & Analysis	Presents quantitative results and interprets findings clearly. Includes discussion of tradeoffs (e.g., latency, throughput, memory, accuracy, scalability, cost efficiency).	20
Demo / System Demonstration	Demonstrates a working system, prototype. Groups are expected to allocate at least 5–10 minutes to demo and evaluation results.	20
Total		100

Presentation Logistics

- **Presentation time:** 20 minutes
- **Q&A:** 5 minutes
- **Maximum total time:** 25 minutes

Recommended Time Allocation

Section	Suggested Time
Motivation + Research Question	2–3 min
Related Work	1–2 min
System Design (primary emphasis)	7–10 min
Evaluation + Experimental Results	4–6 min
Demo	5–10 min
