

CUDA Stream 时间线: 异步 checkpoint 修复前 vs 修复后

decode kernel 挑 KV (fancy indexing) clone (GPU D2D) PCIe 复制 (D2H) 空闲 / 等待 event 同步

修复前 (Before): gather + clone 排在 default stream 上 → decode 被卡住

decode 1 → decode 2 间隔 = ~1700 ms (TPOT 灾难)

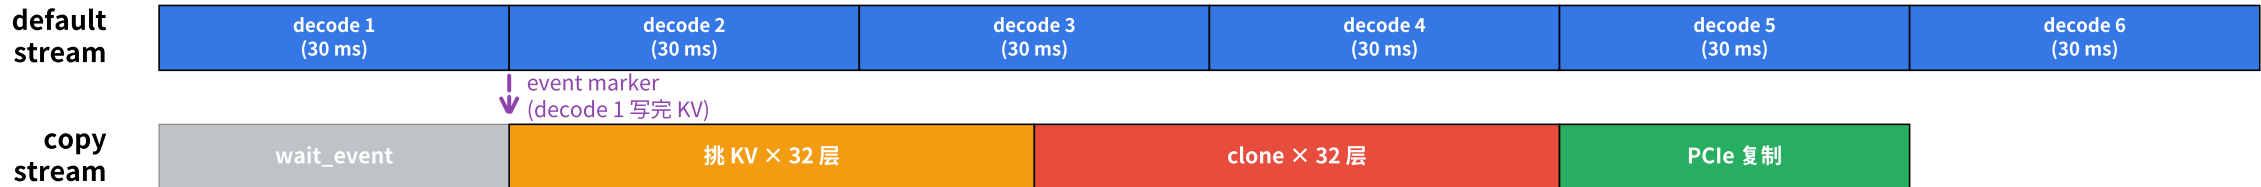

时间 →

修复后 (After): gather + clone 搬到 copy stream → 与 decode 并行

30 ms

← decode 1 → decode 2 间隔回归正常 (~30 ms)

时间 →
